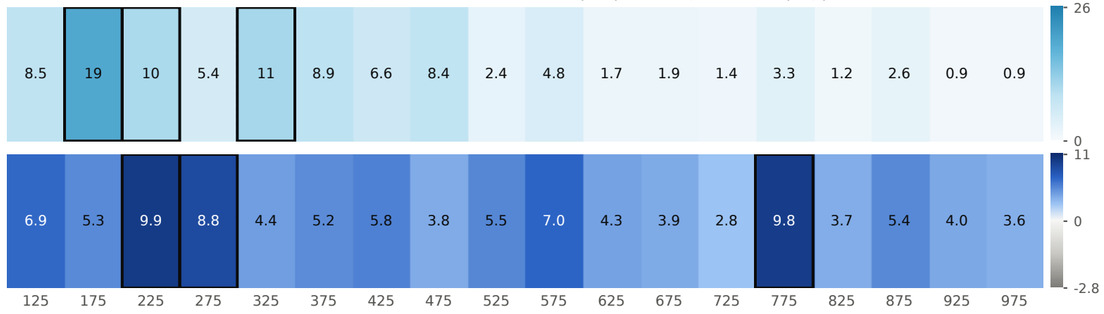
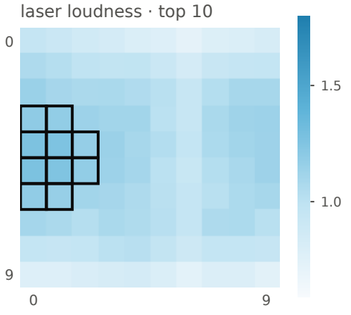
All objects averaged · loudness vs importance per token · train · 240 samples per box

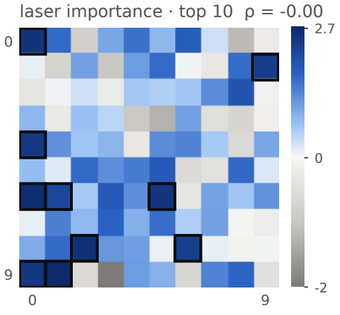
loudness (% of Σ|FFT|): light tint of the box hue · importance (% of Σ|ΔIoU|): deep box hue, gray = removing the token helps (ΔIoU < 0). Same scale per column across boxes. Outlined = top 3 bands / top 10 lasers. Dashed line = 300 Hz. Laser grid: row 0 = top of the wall ROI, col 0 = left.

gastro

loud vs imp: Pearson r +0.26, Spearman ρ +0.53 · <300 Hz: 44% |FFT|, 31% imp · 90% of |imp| in 16/18 bands · IoU 0.91

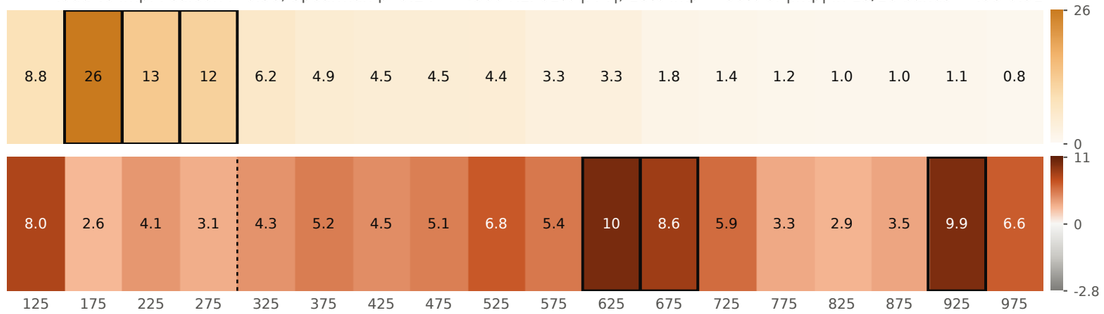


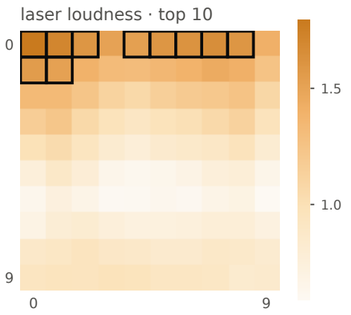


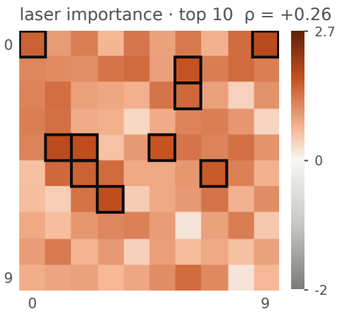


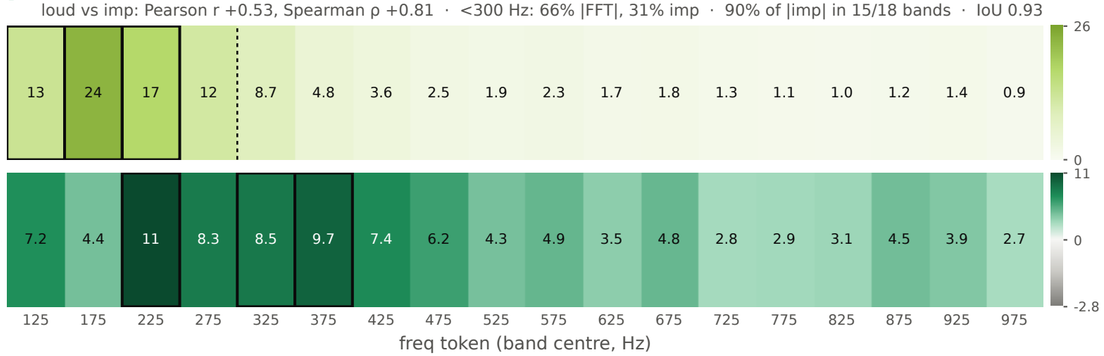
cardboard

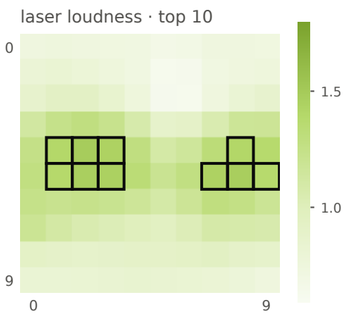
loud vs imp: Pearson r -0.38, Spearman ρ -0.24 · <300 Hz: 61% |FFT|, 18% imp · 90% of |imp| in 15/18 bands · IoU 0.91

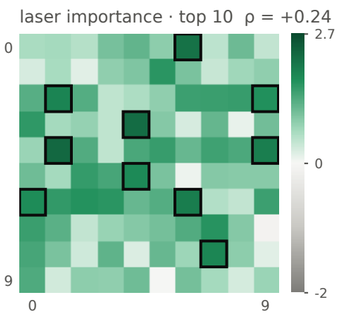






plastic






loud vs imp: Pearson r +0.53, Spearman ρ +0.81 · <300 Hz: 66% |FFT|, 31% imp · 90% of |imp| in 15/18 bands · IoU 0.93
