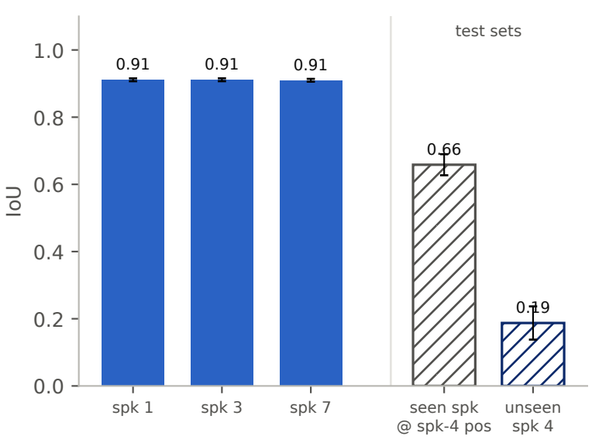
Figure 2d · does performance depend on speaker, position, distance, or vibration axis? · train

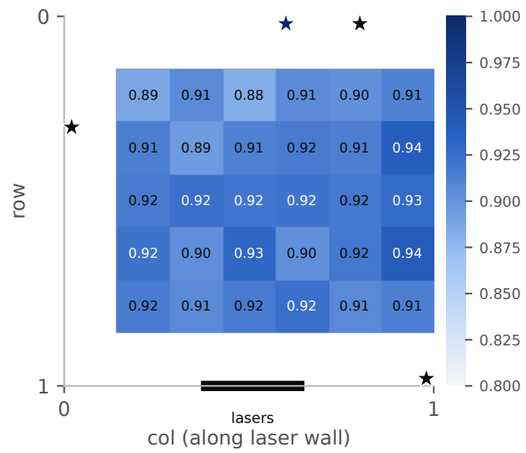
Rows = boxes. Every single-object ID sample (extra.npz). Hatched bars in C = test-only sets (same held-out positions, seen speakers vs unseen speaker 4). Distances in box fractions of the overhead crop (speaker spots from record.ipynb, laser wall = bottom edge).

gastro

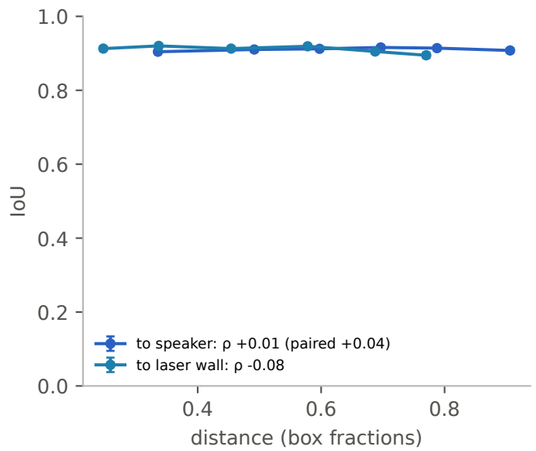
C · IoU by speaker (train, ±95% CI)



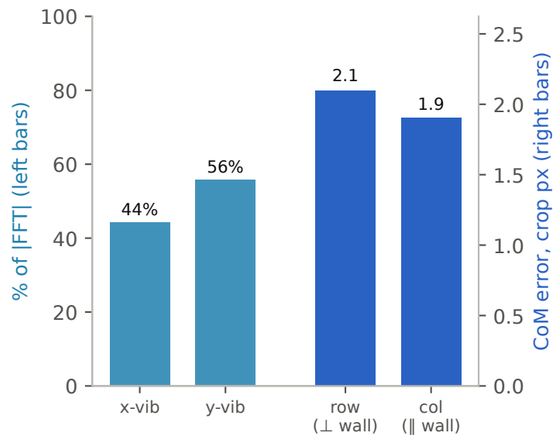
D · IoU by object position (train, ★ speaker)



E · IoU vs distance (train, 6 quantile bins)

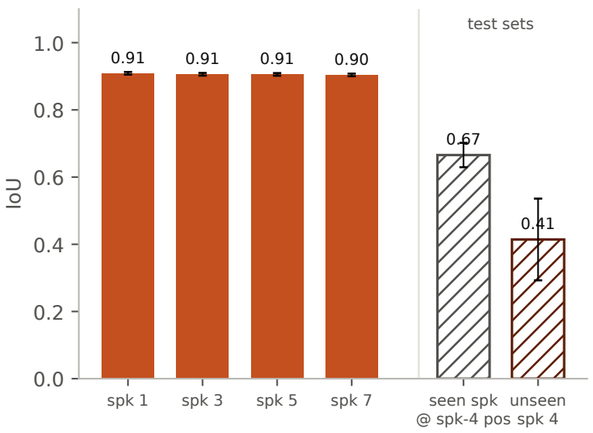


F · energy per axis vs position error (train)

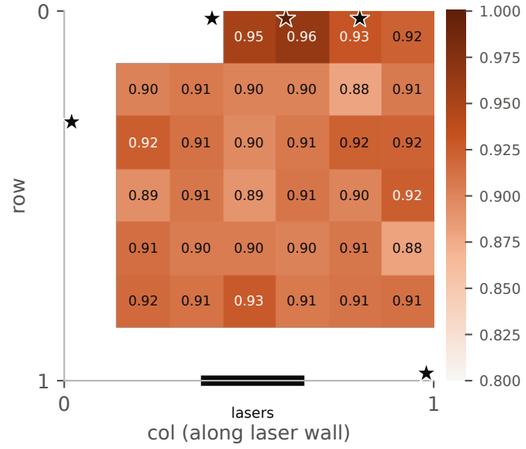


cardboard

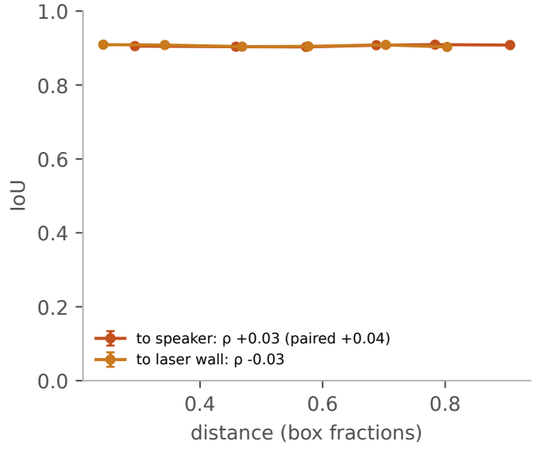
C · IoU by speaker (train, ±95% CI)



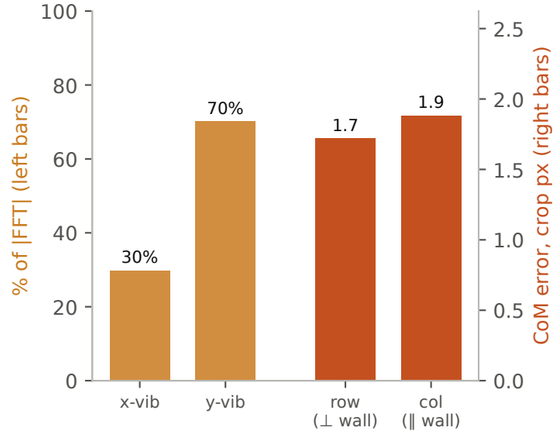
D · IoU by object position (train, ★ speaker)



E · IoU vs distance (train, 6 quantile bins)

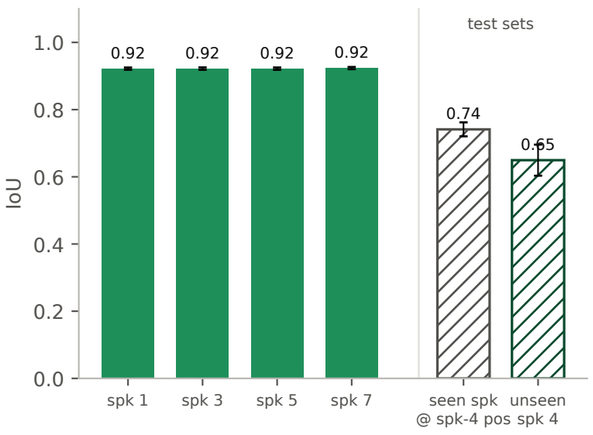


F · energy per axis vs position error (train)

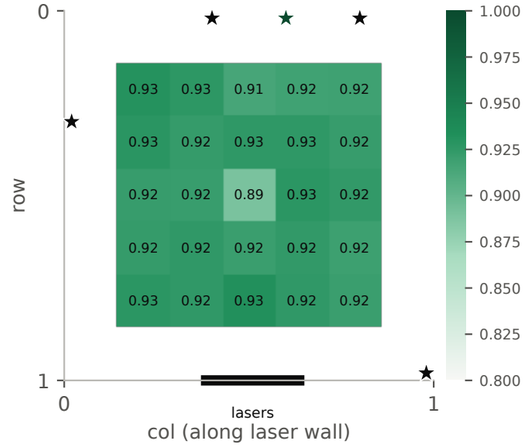


plastic

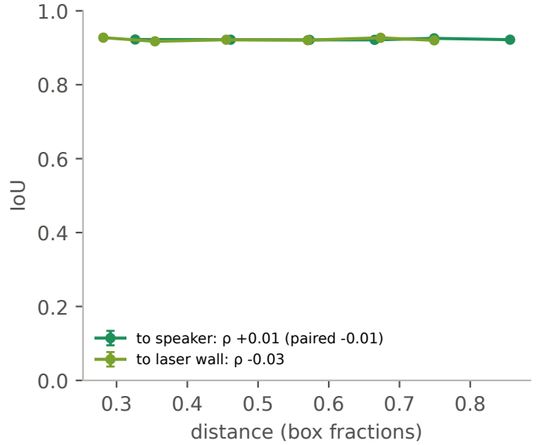
C · IoU by speaker (train, ±95% CI)

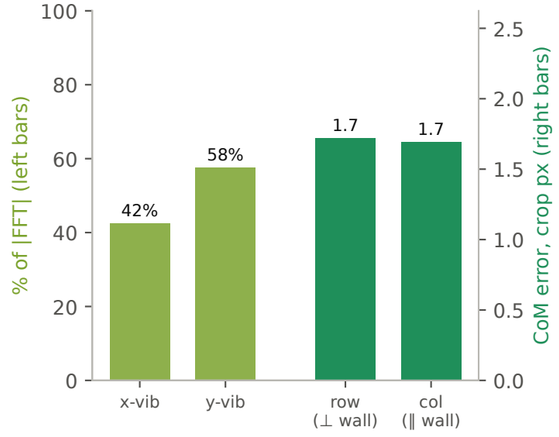


D · IoU by object position (train, ★ speaker)



E · IoU vs distance (train, 6 quantile bins)





F · energy per axis vs position error (train)
